

Certificate of Refrigerant Recovery

Today's service required the temporary removal of refrigerant from your air conditioner or heat pump. This was performed according to EPA standards. No refrigerant was released to environment.

The work was performed by a technician certified to work with the refrigerants through EPA testing. Stewardship of the environment is everyone's responsibility. You can feel confident that your air conditioner or heat pump was serviced in an environmentally responsible manner.

For reduced energy use and environmental impact, we recommend professional maintenance annually and the replacement of systems using Refrigerant 22 (an ozone depleting refrigerant) with systems using Refrigerant 410a (a non-ozone depleting refrigerant). By law, manufacturers will no longer produce air conditioners using Refrigerant 22 after 2009.
